

CyberShield v1.0.0 - Security Report

Scan Overview

Target IP	192.168.0.152
Scan Date	2026-04-25 08:38:27
Tool Version	CyberShield v1.0.0

Vulnerability Scan Results

Detected OS	Unknown
Risk Level	Low
Open Ports	0

File Cleanup Summary

Files Scanned	136
Files Deleted	0
Files Quarantined	0
Files Skipped	0
Space Freed (MB)	0.00 MB

Security Hardening - Score: 65/100

[OK] Firewall Active

Detail: Windows Firewall is ON

[XX] Risky Local Ports

Detail: High-risk ports open: 135 (RPC), 139 (NetBIOS), 445 (SMB), 3389 (RDP)

Fix: Disable unused high-risk services

1. Open PowerShell as Administrator and run these commands:
2. ?? Disable Remote Desktop (RDP port 3389) ??
3. Set-ItemProperty -Path 'HKLM:\System\CurrentControlSet\Control\Terminal Server' -Name fDenyTSConnections -Value 1
4. Disable-NetFirewallRule -DisplayGroup 'Remote Desktop'
5. ?? Disable SMBv1 (port 445 exploit risk) ??
6. Set-SmbServerConfiguration -EnableSMB1Protocol \$false -Force

[!!] Auto-Update Status

Detail: Cannot verify Windows Update status automatically

Fix: Manually verify and enable Windows Update

1. Press Windows + I to open Settings

CyberShield v1.0.0 - Security Report

2. Click 'Windows Update'
3. Click 'Check for updates' - install any pending updates
4. Click 'Advanced options'
5. Turn ON 'Receive updates for other Microsoft products'
6. Set Active hours to match your schedule so updates don't interrupt you

[OK] World-Writable Files

Detail: Not applicable on Windows (uses ACL model)

[!!] Disk Encryption

Detail: BitLocker is disabled - drive not encrypted

Fix: Enable BitLocker to protect your data if laptop is stolen

1. Press Windows + S -> search 'BitLocker'
2. Click 'Manage BitLocker'
3. Click 'Turn on BitLocker' next to your C: drive
4. Choose how to unlock (password or USB key)
5. Save your recovery key to Microsoft account or USB
6. Choose 'Encrypt entire drive' for full protection

[OK] Windows Defender

Detail: Windows Defender is active and running

[!!] Password Policy

Detail: Minimum password length may be set to 0 (no requirement)

Fix: Enforce strong password policy

1. Open PowerShell as Administrator
2. Run: net accounts /minpwlen:12
3. Run: net accounts /maxpwage:90
4. Run: net accounts /minpwage:1
5. Run: net accounts /uniquepw:5
6. Or use: secpol.msc -> Account Policies -> Password Policy

[OK] Guest Account

Detail: Guest account is disabled

Future Security Recommendations

1. Keep Software Updated

Always apply OS and application patches within 72 hours of release. Unpatched software is the #1 entry point for attackers.

2. Enable Multi-Factor Authentication

Enable MFA on all accounts especially email, banking, and SSH access. A compromised password alone will not be enough to breach your account.

3. Use a Password Manager

Never reuse passwords. Use Bitwarden or KeePassXC to generate and store unique credentials for every service you use.

4. Network Segmentation

Separate IoT devices onto a guest VLAN. Printers, smart TVs, and cameras should never share a network segment with sensitive machines.

5. Regular Backups - 3-2-1 Rule

Keep 3 copies of data, on 2 different media types, with 1 stored offsite. Test restoration monthly - backups that cannot be restored are worthless.

6. Monitor Authentication Logs

Review auth logs or Event Viewer weekly. Unexpected login attempts are early warning signs of a compromise attempt on your system.

7. Disable Unused Services

Every open port is an attack surface. Stop and disable services you do not actively use such as telnet, FTP, NetBIOS, SMBv1, and others.

8. Encrypt Sensitive Data at Rest

Use LUKS on Linux, FileVault on macOS, or BitLocker on Windows for full disk encryption. Encrypt individual files with GPG when sharing.

9. Security Awareness Training

90 percent of breaches start with phishing. Always verify email sender addresses, hover links before clicking, never open unexpected attachments.

10. Run Periodic Security Scans

Re-run CyberShield monthly. Also consider running Malwarebytes or ClamAV for layered defence against malware and other threats.
